

Petur Subev

Full-Stack Product Engineer

PROFILE

Product engineer, 15 years shipping in startups and small teams: staff engineer at V7 and Hyperscience, built and led the frontend function at Leanplum. Frontend-deep (React, Vue, TypeScript), full-stack in recent years (Node.js, Fastify, tRPC, PostgreSQL, AWS). I like owning a feature from the database schema to the last CSS detail, and measuring whether it worked.

SKILLS

Frontend: React 19, Vue 3, TypeScript, React Router (SSR), TanStack Query, Pinia, Vite, Electron, CSS Modules, Tailwind

Backend: Node.js, Fastify, tRPC, Zod, Drizzle ORM, PostgreSQL · earlier: ASP.NET MVC, Django, Spring Boot

Product: PostHog analytics & A/B experiments, Stripe payments & IAP, WebAuthn/passkeys, PWA & service workers

Testing: Playwright, Vitest (browser + unit), MSW

AI workflow: Agent-driven development across coding agents (Claude Code and others); review and test discipline for agent-written code

Infra: AWS (S3, CDK), pnpm/Turborepo monorepos, CI/CD, architecture-enforcing lint rules

WORK EXPERIENCE

Senior Full-Stack Engineer · Textclub (Jest.com)

11/2025 – present · Remote

Consumer platform for mobile web games with built-in social features, shipped as an installable PWA. (Team cut after a missed funding round — CEO & CTO recommendations on LinkedIn.)

- Owned the user-facing product end to end — the virtualized Explore feed, the Library activity feed, the Profile tab, and chat — 213 production PRs in 8 months: React 19 SSR, Fastify/tRPC, PostgreSQL/Drizzle, AWS.
- Sustained that pace with agent-driven development, kept honest by conventions the whole team and its agents now ship within: end-to-end types, architecture lint rules, and tests verified to catch regressions — down to snapshot-tested analytics events in e2e.
- Reorganized the whole app's routing from query-string tabs to real React Router routes: shareable URLs, a working back button, faster loads from per-route code splitting and prefetching.
- Built the real-time chat, global and in-game: presence, unread tracking, infinite scrollback (cursor-based pagination). Launched behind a feature flag, then measured as an A/B experiment.
- Built the signup wizard and a layered avatar editor, with server-side image composition (sharp) and A/B/C funnel variants.
- Added passkey (WebAuthn) login and US-only geo-blocking, including linking anonymous players to their eventual accounts.
- Owned checkout: merged three Stripe checkout popups into one, moved in-app purchases to a credit-balance model, added purchase history and post-purchase signup prompts.
- Delivered the platform work that makes the PWA feel native: service worker and caching, safe-area insets, soft-keyboard layout, orientation and fullscreen handling on iOS and Android.

Founding Product Engineer · Powertime.org

01/2025 – 11/2025 · Remote

Real-time collaboration and group-governance platform, shipped as a web app and a desktop app. (Founding bet on a bootstrapped product; wound down when it didn't find traction.)

- Sole frontend engineer (510 commits); built the Vue 3 + TypeScript SPA from scratch with Vite, Pinia, and Tailwind.
- Wrote the WebSocket layer with typed message routing generated from OpenAPI schemas: presence, feed and unread sync, resilient reconnection.
- Set up end-to-end type safety against the Clojure/Datomic backend; a CI job boots the real backend on every PR to regenerate API types and typecheck the frontend against them.
- Packaged the same codebase as an Electron desktop app for Windows, macOS, and Linux, with auto-update and native notifications.
- Built the governance UX (auctions, elections, peer reviews, member induction), with Playwright coverage for multi-user flows.

Staff Frontend Engineer · V7

05/2022 – 12/2024 · Remote

AI data-labeling and document-intelligence SaaS (V7 Go, V7 Darwin).

- Built the heart of V7 Go: a Google-Sheets-like table where every cell is computed by AI — kept responsive on huge datasets by forking and customizing a virtual scroller.
- Owned the spreadsheet interactions the product is judged by — cell types, clipboard paste, column reordering, keyboard focus — plus the Entity View and a markdown editor with mention autocomplete.
- Ran the signup funnel and growth tooling (HubSpot, Google Tag Manager, UTM and referral tracking, Intercom tours) and the paywall and plan-limit UI.
- Earlier, on V7 Darwin: built the consensus-review UI (conflict threads, disagreement resolution inside the annotation workflow), shipped the freemium gating layer, and carried a large share of the Vue 2 → Vue 3 migration.

Staff Software Engineer · Hyperscience

01/2021 – 05/2022 · Sofia

Enterprise ML platform that turns documents into structured data.

- Built human-in-the-loop ML tooling in React + TypeScript: an annotation UI over scanned documents, fed with live model predictions so annotators corrected machine suggestions instead of labeling from zero — lifting both speed and accuracy.
- Extended the component library shared across product teams; mentored peers and improved test coverage and frontend tooling.

Staff Engineer / Frontend Lead · Leanplum (CleverTap)

05/2015 – 01/2021 · SF Bay / Sofia

Mobile marketing-automation platform for enterprise customers.

- First frontend-focused engineer; owned the web dashboard for six years as the company scaled, serving enterprise customers such as Tinder, Tesco, and Lyft.
- Drove two complete migrations (jQuery/Backbone → Angular → Vue + TSX + TypeScript) without pausing feature delivery, and laid the foundation of the next-generation dashboard: Vuex state, unit-tested components.
- Crossed the stack to rewrite the analytics module: a Spring Boot service speaking Protocol Buffers over a custom RPC layer.
- Led the frontend team as it formed around me — 12 engineers at peak — onboarding and mentoring through pair programming and structured feedback.

Software Developer · Telerik (acquired by Progress)

11/2011 – 05/2015 · Bulgaria

Kendo UI — industry-standard JavaScript/HTML5 UI component suite.

- Owned Kendo UI components end to end — research through implementation, testing, and maintenance — plus their ASP.NET MVC server-side wrappers.
- Wrote the public documentation and supported developers directly by ticket and phone — the origin of a 20k+ reputation Stack Overflow profile (top answerer for Kendo UI).

EDUCATION

B.Sc. & M.Sc. Computer Science
Technical University Sofia ·
2007 – 2013

LANGUAGES

English — professional
Bulgarian — native

PROJECTS & COMMUNITY

- [Libratory](#) — local-first audiobook studio, ~39k lines of TypeScript released most days: PDF → chapter-marked M4B, agentic library chat with verified citations, read-along EPUB export; web, Electron and a paid iOS app
- [Stack Overflow](#) — 20k+ reputation, 1,200+ answers, top answerer for Kendo UI
- [Codementor](#) — 5.0★ mentor since 2014
- [sibling-jump.nvim](#) — open-source Tree-sitter code navigation

CERTIFICATES

- Type Transformations — Total TypeScript, 2024
